

RICE

RICE UNIVERSITY FINTECH

BOOT CAMP

CURRICULUM OVERVIEW

“ **Banks are technology firms in disguise.** ”
Chris Skinner*

The field of finance is evolving. Financial services firms, insurance agencies, and investment banks are increasingly at the intersection of data and technology, harnessing programming, machine learning, big data, and blockchain to conduct business.

The 24-week FinTech Boot Camp is a challenging, part-time program that teaches you how to automate and improve financial services using cutting-edge technology.

Throughout the course, you will gain experience with a host of popular tools and methods such as Python programming, financial libraries, machine learning algorithms, Solidity smart contracts, Ethereum, and blockchain. You will learn how these concepts are leveraged within financial fields from insurance to investment banking, as well as best practices for using these skills to add value to your organization.

Is This Program Right For **You**?

Are you looking to advance your existing finance career or interested in breaking into fintech? If so -- or if any of the following describes your situation -- enrolling in this boot camp could be a beneficial career move:

A financial professional who wants to develop technical skills in the wake of their organization's digital transformation.

A technical professional, such as a developer or data analyst, who wants to transition into the financial sector and apply technology to financial products and services.

A technology enthusiast who wants a career in the high-growth, exciting world of fintech.

Skills Gained

You will complete the boot camp with a foundation in Financial Technology and Analysis, including*:

Financial Fundamentals

- Time-Series Analysis
- Financial Ratios
- Financial Analysis
- Financial Modeling

Programming and Financial Libraries

- Python
- Pandas
- PyViz
- APIs
- Amazon Web Services
- SQL
- Numpy
- SciPy

Blockchain and Cryptocurrency

- Solidity
- Ethereum
- Smart Contracts
- Consensus Algorithms
- Transactions
- Validation
- Distributed Ledger
- Cryptocurrency
- Truffle Suite
- Ganache

Machine Learning Applications in Finance

- Algorithmic Trading
- Random Forests
- k-Nearest Neighbors (kNN)
- Support Vector Machines (SVM)
- Linear Regression
- Scikit-learn
- Forecasting
- Logistic Regression
- Deep Learning
- Recurrent Neural Networks
- TensorFlow
- Keras
- AWS SageMaker

*The material covered in this course is subject to change due to market demand.

A man and a woman are smiling and looking at a laptop screen. The man is leaning over the woman, who is sitting at a desk. They are both looking at the laptop screen. The background is a modern office with large windows.

Building On The Basics

Financial institutions are increasingly becoming technology institutions that require not only financial knowledge but deep technical knowledge.

That's why our curriculum is designed to provide you with a deep foundation on the core technical skills needed to succeed in the field. Throughout the program, expect to learn brand new skills and be challenged in completing difficult real-world problems to demonstrate your new abilities. By the end of the boot camp, you will have a strong professional portfolio showcasing your work.

Real World Applications, **Real Jobs**

Those who complete our boot camp will be qualified for a range of roles depending on prior experience, including:

Financial Analyst	FinTech Product Manager
Risk Analyst	Smart Contracts Developer
Investment Data Analyst	Blockchain Project Manager
Financial Manager	Blockchain Developer
Quantitative Trader	Research Analyst
Technology Consultant	Software Engineer
Financial Applications Developer	

What You Will Learn

By the time you complete the boot camp, you can expect to be able to:

Apply modern financial technologies within the context of working at an investment bank, insurance agency, or any player in the financial industry

Employ financial analysis techniques to model, predict, and forecast trends

Model future financial performance of a company using Python and financial fundamentals

Conduct time-series analysis in conjunction with assumptions and variances to develop financial forecasts, and analyze forecasts for accuracy

Create a custom API with mock bank data and configure the API to allow incoming interactions

Learn to work with databases on the AWS cloud in the service of financial applications

Simulate and model financial portfolios using statistical techniques

Make API requests to pull financial data, and use a variety of Python packages to run financial analysis on large datasets

Understand both the uses and disadvantages of a variety of machine learning algorithms and their proper application within the field of finance

Leverage machine learning to determine lending preferences and how effectively a cluster of customers would produce interest

Analyze market behavior using machine learning on historical datasets

Design and implement smart contracts with the Solidity programming language

Determine the optimal predictors for market strategy and evaluate models for accuracy

Build an Ethereum blockchain and understand how transactions are validated on a distributed ledger

Course Structure

Over the course of 24 weeks, you'll attend informative classes, participate in a variety of individual and team exercises, and work independently in and outside of the classroom. Homework assignments provide an opportunity to apply what you've learned and build on it. The goal is to give you a comprehensive learning experience and true insight into a "day in the life" of a fintech professional.

DISCUSSION

Instructor-led discussions cover the background, history, and use of new technologies or concepts.

PROJECT WORK

You'll work on in-class exercises and projects individually and in teams to put classroom teachings into practice.

PORTFOLIO PROJECTS

Your portfolio signals to employers that you are ready for primetime! You'll build a substantial portfolio of projects that demonstrate your abilities across a wide variety of technologies.

We're Here To Help

As you move up the learning curve, you are likely to have questions around some of the concepts covered in class. We're here to help — through office hours, as well as a dedicated Slack channel where you can get assistance from instructors, support staff, and fellow classmates. All work is done via GitHub, so you can create issues directly on your own projects for instructors to assist you in a truly asynchronous fashion. In addition to learning finance, financial programming, and data analysis, you will have access to career services that will help you prepare for technical roles after the boot camp through activities such as:

Career Content and Practice Sessions

Database of Customizable Tools and Templates

- Multiple Technical Resume Templates
- GitHub Best Practices
- Guidelines To Building A Portfolio
- Creating an Elevator Pitch
- Developing a Bio

Online Career Events With Industry Professionals

Soft Skills Training

One-on-One Career Coaching

Meeting **Employer Expectations**

It's a fact: companies care about what a person can do, not what a person says they can do. For that reason, our curriculum teaches you how to apply what you've learned to real world scenarios.

The curriculum emphasizes in-depth projects, ranging from building algorithms for detecting fraud to creating applications that interface with the Ethereum network. You will use your personal laptop to practice the skills and abilities included in this course.

Sample Projects

Currency Predictor (Python and Time Series Analysis)

Description: Large companies often deal with foreign currency transactions while doing international business, and as a result, they are always looking for anything that can help them better understand the future direction and risk of various currencies. In this exercise, you will predict future movements in the value of the Japanese yen versus the U.S. dollar.

Skills

- Python
- Scikit-learn
- Statsmodels
- NumPy
- Pandas
- Linear Regression Forecasting
- APIs
- JSON
- Time-Series Analysis

Objectives

- Use Python packages like NumPy to run financial analysis on the data you retrieve
- Use time-series models to identify predictable patterns in short-term trends and seasonality of currency
- Incorporate useful explanatory data into the predictive models, such as information on weather and physical commodity production

Risky Business (APIs and Statistical Methods)

Description: One of the most important aspects of financial decisioning is the ability to evaluate and manage risk. For analysts especially, this is a critical part of the job description and requires a strong understanding of finance and statistics. Furthermore, the ability to script in Python is a helpful skill to run bulk analysis efficiently. In this exercise, you will assume the role of an analyst tasked with predicting credit risk using free data from peer-to-peer lending services.

Skills

- Python
- Pandas
- APIs
- Statistics
- Financial Modeling
- Scikit-learn

Objectives

- Enforce financial and statistical concepts fundamental to evaluating and managing risk.
- Conduct rigorous statistical methods on financial data from a wide variety of industry sectors.
- Use the imbalanced-learn and scikit-learn libraries to build and evaluate models using the two following techniques: resampling and ensemble learning

Sample Projects continued...

Stock Predictor (Recurrent Neural Networks)

Description: Due to the volatility of cryptocurrency speculation, investors will often try to incorporate sentiment from social media and news articles to help guide their trading strategies. One such indicator is the Crypto Fear and Greed Index (FNG), which attempts to use a variety of data sources to produce a daily FNG value for cryptocurrency. You have been asked to help build and evaluate deep learning models using both the FNG values and simple closing prices to determine if the FNG indicator provides a better signal for cryptocurrencies than the normal closing price data.

Skills

- Python
- TensorFlow
- Keras
- Jupyter Notebook
- Recurrent Neural Networks

Objectives

- Use deep learning recurrent neural networks to model Bitcoin closing prices
- Build and train long short-term models (LSTMs) using multiple data sets
- Evaluate and compare the performance of models

Trading Bot (Algorithmic Trading)

Description: You've just determined a winning stock market trading strategy. The problem? It requires you to make trades extremely precisely -- with little room for error. Fortunately for you, this class will teach you to program and build your own algorithmic trading bot -- capable of responding to incoming market data in real-time.

Skills

- Python
- Pandas
- Numpy
- Machine Learning
- Algorithmic Trading

Objectives

- Utilize Python, Pandas, and a variety of APIs to interpret data streams and market events, and respond with trade activities
- Run analysis to determine the quality of your trading bot's performance

Sample Projects continued...

Robo Advisor (Cloud and Machine Learning)

Description: You have been hired as a consultant by a prominent retirement plan provider. They would like to increase their client portfolio and want you to create a robo advisor that could be used by current and potential customers to get investment portfolio recommendations for retirement. Using machine learning and natural language processing combined with your AWS skills, you will build a bot that will provide those portfolio recommendations.

Skills

- Python
- Machine Learning
- Natural Language Processing
- AWS

Objectives

- Create an Amazon Lex bot that establishes a conversation with a user
- Use machine learning and natural language processing to program the bot to accurately respond to a user based on their input
- Deploy an Amazon Lambda Function to validate data

Profit Splitter (Blockchain and Cryptocurrency)

Description: Your new start-up has created its own Ethereum-compatible blockchain to help connect financial institutions, but now the team wants to use it to help automate some of the company finances. The goal is to make things easier internally, increase transparency, and make accounting and auditing practically automatic. You will develop smart contracts with Solidity to pay employees, distribute profits to different tiers of employees, and distribute company shares for those employees in the equity incentive plan.

Skills

- Solidity
- Ganache
- Blockchain

Objectives

- Script smart contracts using the Solidity programming language
- Script smart contracts to distribute funds and stock equity on a specific schedule using guidelines such as a deferred equity incentive plan
- Deploy contracts to a live Testnet

Course Curriculum By Module

Module	Description	What You'll Learn
Learning Module: Intro to Fintech	You'll begin with a quick, crash course in finance fundamentals. We want to make sure you have a baseline understanding of things like financial modeling and financial statement analysis.	<ul style="list-style-type: none">• Fintech Landscape• Time-Series Analysis• Financial Ratios
Learning Module: Financial Programming	When it comes to analyzing large financial data sets, Python is far more powerful than Excel. By the end of this section, you'll know how to use Python and APIs to run robust financial analyses and build applications that rely on real-time data.	<ul style="list-style-type: none">• Python• Financial Modeling• Pandas• Matplotlib• Statistical Programming• APIs• SQL• NumPy• SciPy• PyViz
Learning Module: Machine Learning Applications in Finance	It's one thing to analyze the past, but it's another to predict future outcomes. You'll learn how to use machine learning techniques to determine credit worthiness, buy and sell stocks, and more.	<ul style="list-style-type: none">• Algorithmic Trading• Random Forests• k-Nearest Neighbors• Support Vector Machines• Scikit-learn• Linear Regression• Logistic Regression• k-Means Clustering• Neural Networks• Forecasting• Amazon Web Services
Learning Module: Blockchain and Cryptocurrency	As the popularity of blockchain has grown, so has the demand for professionals with related skills. You'll develop a technical understanding of how blockchains work and get hands-on experience with Solidity, the most popular blockchain language, and smart-contracts.	<ul style="list-style-type: none">• Solidity• Smart Contracts• Consensus Algorithms• Transactions• Validation• Distributed Ledger• Ethereum• Cryptocurrency• Mining• Truffle Suite• Ganache
